

This document outlines the complete user journey, from initial authentication to asset listing and escrow. It is designed to be shared directly with your development team.

App User Journey & Technical Flow

Phase 1: Authentication & Automated Provisioning

Goal: Ensure every authenticated user has a corresponding record in the application database without manual input.

- **Pre-Condition:** User is already authenticated via **Logto (PKCE flow)**.
- **Step 1.1: The Handshake:** App calls the GET /me endpoint.
- **Step 1.2: Registration Logic:**
 - IF response contains "Register": false:
 - The app must immediately trigger a silent POST /register call.
 - **Payload:** OIDC claims from Logto (e.g., logto_id, email, name).
 - IF response contains "Register": true:
 - Proceed directly to the Lobby.

Pro-Tip: The Skeleton Transition

To avoid a "clunky" registration feel, use a **Skeleton Screen** that mimics the Lobby layout while the /me and (if needed) /register calls are processing. This makes the auto-registration feel like a natural part of the app loading sequence.

Phase 2: The Lobby (Main Dashboard)

Goal: Provide the user with immediate context and market opportunities.

- **Background Actions:** Execute parallel API calls to /me, /portfolio, and /default-market-search.
 - **UI Requirements:**
 - Display **User Balance** (converted to USD).
 - Render **Initial-based Avatar** (e.g., "CF" for Cree Finnikin).
 - Display **Default Token Listing** (featured assets).
-

Phase 3: Commerce & Checkout Flow

Goal: A seamless browsing and multi-method payment experience.

1. **Discovery:** * User clicks a **Token** → View Details → **Add to Cart**.
 - User returns to Lobby → Clicks a **Market Listing** → View Details → **Add to Cart**.
2. **Checkout:**
 - Navigate to Cart → View price/fee estimates.
3. **Payment:** * Select Method: **PIX, Credit Card, Google/Apple Pay, or Crypto**.
 - **Completion:** Redirect back to the Lobby on success.

Phase 4: Merchant Onboarding

Goal: Transition a buyer into a verified seller.

1. **Entry Point:** User selects "**Join market sellers**".
2. **Commitment:** Pay the required **Onboarding Fee** (Deposit).
3. **Identity Verification:** Complete the **KYC** (Know Your Customer) process.
4. **Verification Success:** User is granted access to the **Market Profile**.

Phase 5: Asset Listing & Smart Escrow

Goal: Flexible listing logic based on asset type.

1. **Listing Initiation:** Go to **Market Profile** → Complete **Listing Request** form.
2. **Quote Review:** View system-generated quote, terms, and fees.
3. **Completion Logic:**
 - **Scenario A (On-Chain Asset):** User confirms → System triggers an automated **Escrow** → [Done].
 - **Scenario B (Off-Chain Asset):** System sets status to **Pending** → Awaits physical/manual deposit of the asset and fees → [Done].

Summary of Key Endpoints for Devs

Endpoint	Method	Key Logic
/me	GET	Check Register boolean flag.
/register	POST	Silent provisioning using Logto OIDC claims.

/portfolio	GET	Fetch balances and asset holdings.
/checkout/estimate	POST	Calculate final totals including fees.
/market/list	POST	Differentiate between on-chain escrow and manual pending.
